                                FUNCTION: REQUIRED FOR SURVIVAL AND DIFFERENTIATION OF I LINE CELLS: PLAYS A ROLE IN GERM LINE SEX DETERMINATION.

SUBCELLULAR LOCATION: Nuclear (potential).

DEVELOPMENTAL STAGE: FIRST APPEARS IN THE GERMARIUM AND ACCUMULATES IN NURSE CELLS DURING OGGENESIS. STORED IN THE BUT IS RAPIDLY LOST IN THE EMBRYOS EXCEPT FOR ITS CONTIL PRESENCE IN THE GERM LINE PRECURSOR POLE CELLS.

SIMILARITY: Contains 4 C2H2-type zinc fingers.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        DROME

-i- SUBUNIT: Oligomerizes and associates with TNKS2. Interacts with the cytoplasmic domain of LNEP/Otase in SLC2A4/GLUT4-vesicles. Binds to the N-terminus of telomeric TRF1 via the ANK repeats.

-i- SUBCELLULAR LOCATION: Cytoplasmic, associated with the Golgi and the County of the N-terminus of telomeric TRF1 via the ANK repeats.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      -i-

SIMILARITY: Contains 15 ANK repeats.
SIMILARITY: Contains 1 sterile alpha motif (SAM) domain.
                                                                                                                                                                                                                                                                                                                                                                       PTM:
                                                                                                                                                                                                                                                                                                                                                                                         IsoId=095271-2; Sequence=VSP_004538, VSP_004539;
Note=No experimental confirmation available;
TISSUE SPECIFICITY: Ubiquitous; highest levels in testis.
                                                                                                                                                                                                                                                                                                                                          PTM: Upon insulin-stimulation, phosphorylated on serine residues by MAPK kinases.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             with juxtanuclear SLC2AA/GLUT4-vesicles. A minor proportion is also found at nuclear pore complexes and around the pericentriolar matrix of mitotic centromeres. During interphase, a small fraction of TNKS is found in the nucleus, associated with TRF1.

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           FUNCTION: Essential component of nuclear pore complex. Nucleoporins may be involved in both binding and transl the proteins during nucleocytoplasmic transport.

SUBCELLULAR LOCATION: Nuclear pore complex.

DOMAIN: Contains G-L-F-G repeats.

SIMILARITY: Belongs to the GLFG family of nucleoporins.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           s SWISS-PROT entry is copyright. Riede I. Drextler K., Eschbach M.L., Henning U.;

PUAR sequence of genes 38 encoding a receptor-recognizing pacteriophages T2, K3 and of K3 host range mutants.";

J. Mol. Biol. 194:31-39(1987).

-i- FUNCTION: V938 is at the tip of the long tail fibers of the only tail fibers of the cellular receptor.

-i- nhade recognition site for the cellular receptor.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      P07875;

"Structurally distinct genes for the service protease of Leishmania mexicana are developmentally regulated.";
Mol. Biochem. Parasitol. 57:31-46(1993).

-I- FUNCTION: Has an integral role during the infection of macrophagin the mammalian host.

-I- CATALYTIC ACTIVITY: Preference for hydrophobic residues at P1 are considered and p3'. A model nonapeptide is p1 are considered and p3'.

SUBCELLULAR LOCATION: Outer membrane (By similarity).
DOWALN: CONTAINS 153 IMPERFECT REPEATS OF THE CONSENSUS
OCTAPEFTIDE A-G-Y-G-S-T-L-T; FURTHER ON A 16-RESIDUE AND A
REGIONAL 48-RESIDUE PERIODICITY IS SUPERIMPOSED.
MISCELLAMBOUS: A STRUCTURAL MODEL IS SUGGESTED IN WHICH THE ICE
NUCLEATION PROTEIN DISPLAYS A SYMMETRY RELATED TO THAT OF ICE.
SIMILARITY: Belongs to the bacterial ice nucleation protein
family.
